

LMT70, LMT70A $\pm 0.1^\circ\text{C}$ Precision Analog Temperature Sensor, RTD and Precision NTC Thermistor IC

1 Features

- Accuracy:
 - $\pm 0.05^\circ\text{C}$ (typ) or $\pm 0.13^\circ\text{C}$ (max) at 30°C
 - $\pm 0.2^\circ\text{C}$ (max) from 20°C to 90°C
 - $\pm 0.23^\circ\text{C}$ (max) from 90°C to 110°C
 - $\pm 0.36^\circ\text{C}$ (max) from -55°C to 150°C
- Wide Temperature Range: -55°C to 150°C
- Matching of Two Adjacent LMT70A on Tape and Reel: 0.1°C (max) at 30°C
- Very Linear Analog Temperature Sensor with Output Enable Pin
- NTC Output Slope: $-5.19\text{ mV}/^\circ\text{C}$
- Output On/Off Switch with $R_{\text{DS on}} < 80\ \Omega$
- Wide Power Supply Range: 2.0 V to 5.5 V
- Low Power Supply Current: $12\ \mu\text{A}$ (max)
- Ultra Small 0.88 mm by 0.88 mm 4-bump WLCSP (Ball Grid) Package

2 Applications

- Internet of Things (IoT) Sensor Nodes
- Industrial RTD (Class AA) or Precision NTC/PTC Thermistor Replacement
- Medical/Fitness Equipment
- Medical Thermometer
- Human Body temperature monitor
- Metering Temperature Compensation

3 Description

The LMT70 is an ultra-small, high-precision, low-power CMOS analog temperature sensor with an output enable pin. Applications for the LMT70 include virtually any type of temperature sensing where cost-effective, high precision and low-power are required, such as Internet of Things (IoT) sensor nodes, medical thermometers, high-precision instrumentation and battery powered devices. The LMT70 is also a great replacement for RTD and precision NTC/PTC thermistors.

Its output enable pin allows multiple LMT70s to share one ADC channel, thus simplifying ADC calibration and reducing the overall system cost for precision temperature sensing. The LMT70 also has a linear and low impedance output allowing seamless interface to an off-the-shelf MCU/ADC. Dissipating less than $36\ \mu\text{W}$, the LMT70 has ultra-low self-heating supporting its high-precision over a wide temperature range.

The LMT70A provides unparalleled temperature matching performance of 0.1°C (max) for two adjacent LMT70A's picked from the same tape and reel. Therefore, the LMT70A is an ideal solution for energy metering applications requiring heat transfer calculations.

Device Information⁽¹⁾

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LMT70	DSBGA - WLCSP (4)	$0.88\text{ mm} \times 0.88\text{ mm}$

6 Device Comparison Table

Order Number	Matching Specification Provided ⁽¹⁾
LMT70YFQR, LMT70YFQT	No
LMT70AYFQR, LMT70AYFQT	Yes, 0.1°C at approximately 30°C ⁽¹⁾

- (1) In order to meet the matching specification of the LMT70A, two units must be picked from adjacent positions from one tape and reel. If PCB rework is required, involving the LMT70A, then the pair of the LMT70A matched units must be replaced. Matching features (which include, without limitation, electrical matching characteristics of adjacent Components as they are delivered in original packaging from TI) are warranted solely to the extent that the purchaser can demonstrate to TI's satisfaction that the particular Component(s) at issue were adjacent in original packaging as delivered by TI. Customers should be advised that the small size of these Components means they are not individually traceable at the unit level and it may be difficult to establish the original position of the Components once they have been removed from that original packaging as delivered by TI.

7 Pin Configuration and Functions

Pin Functions

PIN		TYPE	EQUIVALENT CIRCUIT	DESCRIPTION
NAME	NO.			
GND	A1	Ground		Ground reference for the device
VDD	A2	Power		Supply voltage
TAO	B1	Analog Output		Temperature analog output pin
T_ON	B2	Digital Input		<p>T_ON pin. Active High input. If T_ON = 0, then the TAO output is open. If T_ON = 1, then TAO pin is connected to the temperature output voltage. Tie this pin to VDD if not used.</p>

8 Specifications

8.1 Absolute Maximum Ratings⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
Supply voltage	-0.3	6	V
Voltage at T_ON and TAO	-0.3	6	V
Current at any pin		5	mA
Storage temperature range	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) Soldering process must comply with Reflow Temperature Profile specifications. Refer to www.ti.com/packaging.

8.2 ESD Ratings

		VALUE	UNIT
V _(ESD) Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	±2000	V
	Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	±750	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

	MIN	NOM	MAX	UNIT
Specified temperature (T _{MIN} ≤ T _A ≤ T _{MAX})	-55		150	°C
Supply voltage	2.0		5.5	V

8.4 Thermal Information

THERMAL METRIC ⁽¹⁾		LMT70 DSBGA or WLCSP 4 PINS	UNIT
R _{θJA}	Junction-to-ambient thermal resistance	187	°C/W
R _{θJC(top)}	Junction-to-case (top) thermal resistance	2.3	
R _{θJB}	Junction-to-board thermal resistance	105	
ψ _{JT}	Junction-to-top characterization parameter	10.9	
ψ _{JB}	Junction-to-board characterization parameter	104	
	Thermal response time to 63% of final value in stirred oil (dominated by PCB see layout)	1.5	sec
	Thermal response time to 63% of final value in still air (dominated by PCB see layout)	73	sec

- (1) Accuracy is defined as the error between the measured and reference output voltages, tabulated in the Conversion Table at the specified conditions of supply voltage and temperature (expressed in °C). These stated accuracy limits are with reference to the values in [Electrical Characteristics Temperature Lookup Table \(LUT\)](#), see Accuracy Curve for other temperatures. Accuracy limits do not include load regulation or aging; they assume no DC load.
- (2) The accuracy temperature coefficient specification is given to indicate part to part performance and does not correlate to the limits given in the curve [Figure 3](#).
- (3) In order to meet the matching specification of the LMT70A, two units must be picked from adjacent positions from one tape and reel. If PCB rework is required, involving the LMT70A, then the pair of the LMT70A matched units must be replaced. Matching features (which include, without limitation, electrical matching characteristics of adjacent Components as they are delivered in original packaging from TI) are warranted solely to the extent that the purchaser can demonstrate to TI's satisfaction that the particular Component(s) at issue were adjacent in original packaging as delivered by TI. Customers should be advised that the small size of these Components means they are not individually traceable at the unit level and it may be difficult to establish the original position of the Components once they have been removed from that original packaging as delivered by TI.
- (4) Determined using accelerated operational life testing at 150°C junction temperature; not tested during production.
- (5) Dropout voltage (VDO) is defined as the smallest possible differential voltage measured between V_{TAO} and VDD that causes the temperature error to degrade by 0.02°C .

Electrical Characteristics (continued)

 Limits apply for $T_A = T_J = T_{MIN}$ to T_{MAX} and VDD of 2.00V to 5.5V and $V_{DD} \geq V_{TAO} + 1V$, unless otherwise noted.

PARAMETER	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Power Supply Current				12	μA
Shutdown Current	VDD \leq 0.4V (-55°C to +110°C)			50	nA
	VDD \leq 0.4V (+110°C to +150°C)			350	nA

9 Detailed Description

9.1 Overview

The LMT70 is a precision analog output temperature sensor. It includes an output switch that is controlled by the T_ON digital input. The output switch enables the multiplexing of several devices onto a single ADC input thus expanding on the ADC input multiplexer capability.

The temperature sensing element is comprised of simply stacked BJT base emitter junctions that are biased by a current source. The temperature sensing element is then buffered by a precision amplifier before being connected to the output switch. The output amplifier has a simple class AB push-pull output stage that enables the device to easily source and sink current.

9.2 Functional Block Diagram

9.3 Feature Description

9.3.1 Temperature Analog Output (TAO)

The TAO push-pull output provides the ability to sink and source current. This is beneficial when, for example, driving dynamic loads like an input stage on an analog-to-digital converter (ADC). In these applications the source current is required to quickly charge the input capacitor of the ADC. See the [Typical Application](#) section for more discussion of this topic. The LMT70 is ideal for this and other applications which require strong source or sink current.

9.3.1.1 LMT70 Output Transfer Function

The LMT70 output voltage transfer function appears to be linear, but upon close inspection it can be seen that it is truly not linear and can be better described by a second or third order transfer function equation.

Feature Description (continued)

Figure 22. LMT70 Output Transfer Function

9.3.1.1.1 First Order Transfer Function

A first order transfer function can be used to calculate the temperature LMT70 is sensing but over a wide temperature range it is the least accurate method. An equation can be easily generated using the LUT (Look-Up Table) information found in [Electrical Characteristics Temperature Lookup Table \(LUT\)](#).

Over a narrow 10°C temperature range a linear equation will yield very accurate results. It is actually recommended that over a 10°C temperature range linear interpolation be used to calculate the temperature the device is sensing. When this method is used the accuracy minimum and maximum specifications would meet the values given in [Figure 3](#).

For example the first order equation between 20°C and 30°C can be generated using the typical output voltage levels as given in [Electrical Characteristics Temperature Lookup Table \(LUT\)](#) and partially repeated here for reference from 20°C to 50°C:

Feature Description (continued)
Table 1. Output Voltage LUT

Temperature (°C)	V _{TAO} (mV)			Local Slope (mV/°C)
	MIN	TYP	MAX	
20	994.367	995.050	995.734	-5.171
30	942.547	943.227	943.907	-5.194
40	890.423	891.178	891.934	-5.217
50	838.097	838.882	839.668	-5.241

First calculate the slope:

$$m = (T_1 - T_2) \div [(V_{TAO}(T_1) - V_{TAO}(T_2))]$$

$$m = (20^\circ\text{C} - 30^\circ\text{C}) \div (995.050 \text{ mV} - 943.227 \text{ mV})$$

$$m = -0.193 \text{ }^\circ\text{C/mV}$$

Then calculate the y intercept b:

$$b = (T_1) - (m \times V_{TAO}(T_1))$$

$$b = 20^\circ\text{C} - (-0.193 \text{ }^\circ\text{C/mV} \times 995.050 \text{ mV})$$

$$b = 212.009^\circ\text{C}$$

Thus the final equation used to calculate the measured temperature (T_M) in the range between 20°C and 30°C is:

$$T_M = m \times V_{TAO} + b$$

$$T_M = -0.193 \text{ }^\circ\text{C/mV} \times V_{TAO} + 212.009^\circ\text{C}$$

where V_{TAO} is in mV and T_M is in °C.

9.3.1.1.2 Second Order Transfer Function

A second order transfer function can give good results over a wider limited temperature range. Over the full temperature range of -55°C to +150°C a single second order transfer function will have increased error at the temperature extremes. Using least squares sum method a best fit second order transfer function was generated using the values in [Electrical Characteristics Temperature Lookup Table \(LUT\)](#):

$$T_M = a (V_{TAO})^2 + b (V_{TAO}) + c$$

where:

	Best fit for -55°C to 150°C	Best fit for -10°C to 110°C
a	-8.451576E-06	-7.857923E-06
b	-1.769281E-01	-1.777501E-01
c	2.043937E+02	2.046398E+02

and V_{TAO} is in mV and T_M is in °C.

9.3.1.1.3 Third Order Transfer Function

Over a wide temperature range the most accurate single equation is a third order transfer function. Using least squares sum method a best fit third order transfer function was generated using the values in [Figure 3](#):

$$T_M = a (V_{TAO})^3 + b (V_{TAO}) + c(V_{TAO}) + d$$

where:

	Best fit for -55°C to 150°C	Best fit for -10°C to 110°C
a	-1.064200E-09	-1.809628E-09
b	-5.759725E-06	-3.325395E-06
c	-1.789883E-01	-1.814103E-01
d	2.048570E+02	2.055894E+02

and V_{TAO} is in mV and T_M is in °C.

9.3.1.2 LMT70A TAO Matching

In order to meet the matching specification of the LMT70A, two units must be picked from adjacent positions from one tape and reel. If PCB rework is required, involving the LMT70A, then the pair of the LMT70A matched units must be replaced. Matching features (which include, without limitation, electrical matching characteristics of adjacent Components as they are delivered in original packaging from TI) are warranted solely to the extent that the purchaser can demonstrate to TI’s satisfaction that the particular Component(s) at issue were adjacent in original packaging as delivered by TI. Customers should be advised that the small size of these components means they are not individually traceable at the unit level and it may be difficult to establish the original position of the Components once they have been removed from that original packaging as delivered by TI.

9.3.1.3 TAO Noise Considerations

A load capacitor on TAO pin can help to filter noise.

For noisy environments, TI recommends at minimum 100 nF supply decoupling capacitor placed close across VDD and GND pins of LMT70.

9.3.1.4 TAO Capacitive Loads

TAO handles capacitive loading well. In an extremely noisy environment, or when driving a switched sampling input on an ADC, it may be necessary to add some filtering to minimize noise coupling. Without any precautions, the V_{TAO} can drive a capacitive load less than or equal to 1 nF as shown in [Figure 23](#). For capacitive loads greater than 1 nF, a series resistor is required on the output, as shown in [Figure 24](#), to maintain stable conditions.

Figure 23. LMT70 No Isolation Resistor Required

Figure 24. LMT70 With Series Resistor for Capacitive Loading Greater than 1 nF

Table 2. C_{LOAD} and R_S Values of Figure 24

C_{LOAD}	Minimum R_S
1.1 to 90 nF	3 k Ω
90 to 900 nF	1.5 k Ω
0.9 μ F	750 Ω

9.3.2 T_{ON} Digital Input

The T_{ON} digital input enables and disables the analog output voltage presented at the TAO pin by controlling the state of the internal switch that is in series with the internal temperature sensor circuitry output. When T_{ON} is driven to a logic "HIGH" the temperature sensor output voltage is present on the TAO pin. When T_{ON} is set to a logic "LOW" the TAO pin is set to a high impedance state.

9.3.3 Light Sensitivity

Although the LMT70 package has a protective backside coating that reduces the amount of light exposure on the die, unless it is fully shielded, ambient light will still reach the active region of the device from the side of the package. Depending on the amount of light exposure in a given application, an increase in temperature error should be expected. In circuit board tests under ambient light conditions, a typical increase in error may not be observed and is dependent on the angle that the light approaches the package. The LMT70 is most sensitive to IR radiation. Best practice should include end-product packaging that provides shielding from possible light sources during operation.

9.4 Device Functional Modes

The LMT70 is a simple precise analog output temperature sensor with a switch in series with its output. It has only two functional modes: output on or output off.

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The LMT70 analog output temperature sensor is an ideal device to connect to an integrated 12-Bit ADC such as that found in the MSP430 microcontroller family.

Applications for the LMT70 included but are not limited to: IoT based temperature sensor nodes, medical fitness equipment (e.g. thermometers, fitness/smart bands or watches, activity monitors, human body temperature monitor), Class AA or lower RTD replacement, precision NTC or PTC thermistor replacement, instrumentation temperature compensation, metering temperature compensation (e. g. heat cost allocator, heat meter).

10.2 Typical Application

Figure 25. Typical Application Schematic

Most CMOS ADCs found in microcontrollers and ASICs have a sampled data comparator input structure. When the ADC charges the sampling cap, it requires instantaneous charge from the output of the analog source such as the LMT70 temperature sensor and many op amps. This requirement is easily accommodated by the addition of a capacitor (C_{FILTER}) or the extension of the ADC acquisition time thus slowing the ADC sampling rate. The size of C_{FILTER} depends on the size of the sampling capacitor and the sampling frequency. Since not all ADCs have identical input stages, the charge requirements will vary. The general ADC application shown in [Figure 26](#) is an example only. The application in [Figure 25](#) was actually tried and the extension of the MSP430 12-Bit ADC acquisition time was all that was necessary in order to accommodate the LMT70's output stage drive capability.

Typical Application (continued)

Figure 26. Suggested Connection to a Sampling Analog-to-Digital Converter Input Stage

10.2.1 Design Requirements

The circuit show in [Figure 25](#) will support the design requirements as shown in [Table 3](#).

Table 3. Design Requirements

PARAMETER	TARGET SPECIFICATION
Temperature Range	-40°C to +150°C LMT70, -40°C to +85°C for MSP430
Accuracy	±0.2°C typical over full temperature range
VDD	2.2V to 3.6V with typical of 3.0V
IDD	12µA

10.2.2 Detailed Design Procedure

10.2.2.1 Temperature Algorithm Selection

Of the three algorithms presented in this datasheet, linear interpolation, second order transfer function or third order transfer function, the one selected will be determined by the users microcontroller resources and the temperature range that will be sensed. Therefore, a comparison of the expected accuracy from the LMT70 is given here. The following curves show effect on the accuracy of the LMT70 when using each of the different algorithms/equations given in [LMT70 Output Transfer Function](#). The first curve ([Figure 27](#)) shows the performance when using linear interpolation of the LUT values shown in [Electrical Characteristics Temperature Lookup Table \(LUT\)](#) of every 10°C and provides the best performance. Linear interpolation of the LUT values shown in [Electrical Characteristics Temperature Lookup Table \(LUT\)](#) is used to determine the LMT70 min/max accuracy limits as shown in the [Electrical Characteristics](#) and the red lines of [Figure 27](#). The other lines in the middle of [Figure 27](#) show independent device performance. The green limit lines, shown in the subsequent figures, apply for the specific equation used to convert the output voltage of the LMT70 to temperature. The equations are shown under each figure for reference purposes. The green lines show the min/max limits when set in a similar manner to the red limit lines of [Figure 27](#). The limits shown in red for [Figure 27](#) are repeated in all the figures of this section for comparison purposes.

10.2.2.2 ADC Requirements

The ADC resolution and its specifications as well as reference voltage and its specifications will determine the overall system accuracy that you can obtain. For this example the 12-bit SAR ADC found in the MSP430 was used as well as its integrated reference. At first glance the specifications may not seem to be precise enough to actually be used with the LMT70 but the MSP430 ADC and integrated reference errors are actually measured during production testing of the MSP430. Values are then provided to user for software calibration. These calibration values are located in the MSP430A device descriptor tag-length-value (TLV) structure and found in the device-specific datasheet. The MSP430 Users Guide includes information on how to use these calibration values to calibrate the ADC reading. The specific values used to calibrate the ADC readings are: CAL_ADC_15VREF_FACTOR, CAL_ADC_GAIN_FACTOR and CAL_ADC_OFFSET.

10.2.3 Finer Resolution LUT

The following table is given for reference only and not meant to be used for calculation purposes.

Temp (°C)	V _{TAO} (mV)	Temp (°C)	V _{TAO} (mV)	Temp (°C)	V _{TAO} (mV)	Temp (°C)	V _{TAO} (mV)	Temp (°C)	V _{TAO} (mV)	Temp (°C)	V _{TAO} (mV)	Temp (°C)	V _{TAO} (mV)	Temp (°C)	V _{TAO} (mV)

10.2.4 Application Curves

The LMT70 performance using the MSP430 is shown in Figure 32. This curve includes the error of the MSP430 integrated 12-bit ADC and reference as shown in the schematic Figure 25. The MSP430 was kept at room temperature and the LMT70 was submerged in a precision temperature calibration oil bath. A calibrated temperature probe was used to monitor the temperature of the oil. As can be seen in Figure 32 the combined performance on the MSP430 and the LMT70 is better than 0.12°C for the entire -40°C to +150°C temperature range. The only calibration performed was with software using the MSP430A device descriptor tag-length-value (TLV) calibration values for ADC and VREF error.

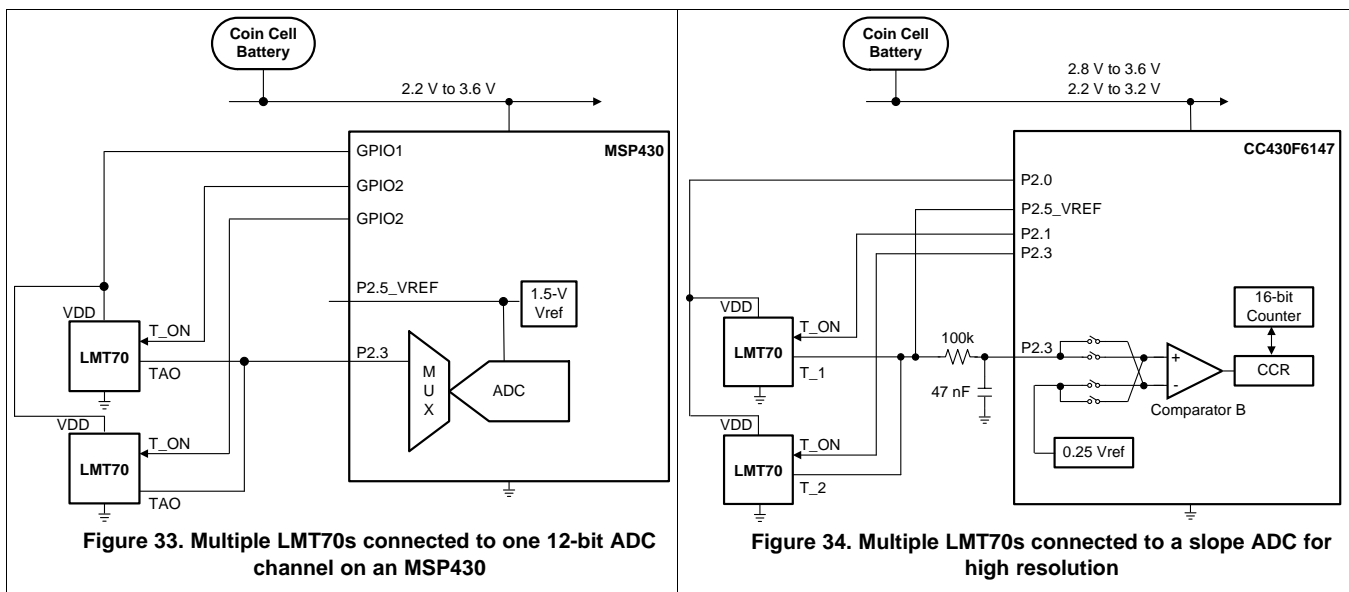

Figure 32. LMT70 with MSP430 typical performance

10.3 System Examples

11 Power Supply Recommendations

Power supply bypass capacitors are optional and may be required if the supply line is noisy. It is recommended that a local supply decoupling capacitor be used to reduce noise. For noisy environments, TI recommends a 100 nF supply decoupling capacitor placed closed across VDD and GND pins of LMT70.

12 Layout

12.1 Layout Guidelines

The LMT70 can be applied easily in the same way as other integrated-circuit temperature sensors. It can be glued or cemented to a surface. The temperatures of the lands and traces to the other leads of the LMT70 will also affect the temperature reading.

12.1.1 Mounting and Temperature Conductivity

Alternatively, the LMT70 can be mounted inside a sealed-end metal tube, and can then be dipped into a bath or screwed into a threaded hole in a tank. As with any IC, the LMT70 and accompanying wiring and circuits must be kept insulated and dry, to avoid leakage and corrosion. This is especially true if the circuit may operate at cold temperatures where condensation can occur. If moisture creates a short circuit from the TAO output to ground or VDD, the TAO output from the LMT70 will not be correct. Printed-circuit coatings are often used to ensure that moisture cannot corrode the leads or circuit traces.

The LMT70's junction temperature is the actual temperature being measured. The thermal resistance junction-to-ambient ($R_{\theta JA}$) is the parameter (from [Thermal Information](#)) used to calculate the rise of a device junction temperature due to its power dissipation. [Equation 1](#) is used to calculate the rise in the LMT70's die temperature.

$$T_J = T_A + R_{\theta JA} [(V_{DD}I_Q) + (V_{DD} - V_{TEMP}) I_L]$$

where

- T_A is the ambient temperature.
- I_Q is the quiescent current.
- I_L is the load current on V_{TEMP} .

(1)

For example, in an application where $T_A = 30^\circ\text{C}$, $V_{DD} = 3\text{ V}$, $I_{DD} = 12\mu\text{A}$, $V_{TAO} = 943.227\text{ mV}$, and $I_L = 0\mu\text{A}$, the total temperature rise would be $[187^\circ\text{C/W} \times 3\text{ V} \times 12\mu\text{A}] = 0.007^\circ\text{C}$. To minimize self-heating, the load current on TAO pin should be minimized.

14 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead/Ball Finish (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMT70AYFQR	PREVIEW	DSBGA	YFQ	4		Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-50 to 150		
LMT70AYFQT	PREVIEW	DSBGA	YFQ	4		Green (RoHS & no Sb/Br)	SNAGCU	Level-1-260C-UNLIM	-50 to 150		

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBsolete: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
