

USB Charging Port Controller and Power Switch with Load Detection

Check for Samples: [TPS2543](#)

FEATURES

- D+/D– CDP/DCP Modes per USB Battery Charging Specification 1.2
- D+/D– Shorted Mode per Chinese Telecommunication Industry Standard YD/T 1591-2009
- D+/D– Divider Modes 2.0V/2.7V and 2.7/2.0V Compliant with 1A and 2A Apple Mobile Digital Devices
- Automatic Selection of D+/D– Mode for an Attached Device
- Supports Sleep-Mode Charging and Mouse/Keyboard (Low-Speed Only) Wake Up
- Load Detection for Both Power Supply Control in S4/S5 Charging and Port Power Management in all Charge Modes
- Compatible with USB 2.0 and 3.0 Power Switch Requirements
- 73-mΩ (typ) High-Side MOSFET
- Adjustable Current-Limit up to 3.0 A (typ)
- Operating Range: 4.5 V to 5.5 V
- Drop-In Compatible with TPS2540/40A
- Available in 16-Pin QFN (3x3) Package
- UL Listed and CB File No. E169910

APPLICATIONS

- USB Ports (Host and Hubs)
- Notebook Desktop PCs
- Universal Wall Charging Adapters

DESCRIPTION

The TPS2543 is a USB charging port controller and power switch with an integrated USB 2.0 high-speed data line (D+/D–) switch. The TPS2543 provides the electrical signatures on D+/D– to support the following charging schemes:

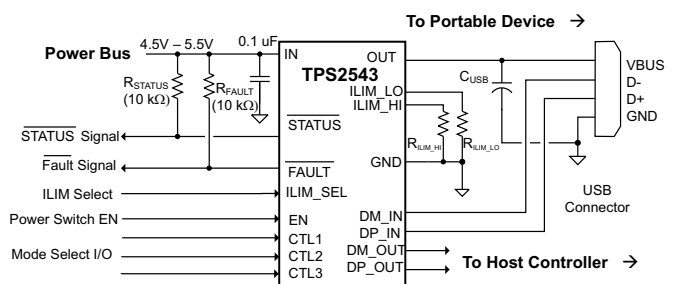

- USB Battery Charging Specification 1.2;
- Chinese Telecom Standard YD/T 1591-2009;
- Divider Mode, Compliant with Apple iPod, iPhone (1A), and iPad (2A) Mobile Digital Devices.⁽¹⁾

The TPS2543 can be configured to automatically select the D+/D– mode needed to charge an attached device. The TPS2543 provides load detection via the STATUS pin that allows for both power supply control in S4/S5 charging and the ability to manage port power in a multi-port application. Additionally, system wake up (from S3) with a mouse/keyboard (low speed only) is fully supported in the TPS2343.

The TPS2543 73-mΩ power-distribution switch is intended for applications where heavy capacitive loads and short-circuits are likely to be encountered. Two programmable current thresholds provide flexibility for setting current limits and load detect thresholds.

(1) Apple, iPod, iPhone, and iPad are trademarks of Apple Inc., registered in the U.S. and other countries.

TPS2543 RTE PACKAGE AND TYPICAL APPLICATION DIAGRAM

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ORDERING INFORMATION⁽¹⁾

| T _A | PACKAGE | DEVICE | TOP-SIDE MARKING |
|----------------|---------|---------|------------------|
| -40°C to 125°C | QFN16 | TPS2543 | 2543 |

- (1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or see the TI web site at www.ti.com.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

over operating free-air temperature range, voltages are referenced to GND (unless otherwise noted)

| | | LIMIT | UNIT |
|--|--|---------------------------|------|
| Voltage range | IN, EN, ILIM_LO, ILIM_HI, <u>FAULT</u> , <u>STATUS</u> , ILIM_SEL, CTL1, CTL2, CTL3, OUT | -0.3 to 7 | V |
| | IN to OUT | -7 to 7 | |
| | DP_IN, DM_IN, DP_OUT, DM_OUT | -0.3 to (IN + 0.3) or 5.7 | |
| Input clamp current | DP_IN, DM_IN, DP_OUT, DM_OUT | ±20 | mA |
| Continuous current in SDP or CDP mode | DP_IN to DP_OUT or DM_IN to DM_OUT | ±100 | mA |
| Continuous current in BC1.2 DCP mode | DP_IN to DM_IN | ±50 | mA |
| Continuous output current | OUT | Internally limited | |
| Continuous output sink current | <u>FAULT</u> , <u>STATUS</u> | 25 | mA |
| Continuous output source current | ILIM_LO, ILIM_HI | Internally limited | mA |
| ESD rating | HBM | 2 | kV |
| | HBM wrt GND and each other, DP_IN, DM_IN | 8 | |
| | CDM | 500 | V |
| Operating junction temperature, T _J | | -40 to Internally limited | °C |

- (1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

THERMAL INFORMATION

| THERMAL METRIC ⁽¹⁾ | | TPS2543 | UNITS |
|-------------------------------|--|--------------|-------|
| | | RTE (16 PIN) | |
| θ _{JA} | Junction-to-ambient thermal resistance | 53.4 | °C/W |
| θ _{JCtop} | Junction-to-case (top) thermal resistance | 51.4 | |
| θ _{JB} | Junction-to-board thermal resistance | 17.2 | |
| ψ _{JT} | Junction-to-top characterization parameter | 3.7 | |
| ψ _{JB} | Junction-to-board characterization parameter | 20.7 | |
| θ _{JCbot} | Junction-to-case (bottom) thermal resistance | 3.9 | |

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](http://www.ti.com/lit/an/spra953).

RECOMMENDED OPERATING CONDITIONS

voltages are referenced to GND (unless otherwise noted)

| | | MIN | NOM | MAX | UNIT |
|----------------|---|------|-----|----------|------|
| V_{IN} | Input voltage, IN | 4.5 | | 5.5 | V |
| | Input voltage, logic-level inputs, EN, CTL1, CTL2, CTL3, ILIM_SEL | 0 | | 5.5 | V |
| | Input voltage, data line inputs, DP_IN, DM_IN, DP_OUT, DM_OUT | 0 | | V_{IN} | V |
| V_{IH} | High-level input voltage, EN, CTL1, CTL2, CTL3, ILIM_SEL | 1.8 | | | V |
| V_{IL} | Low-level input voltage, EN, CTL1, CTL2, CTL3, ILIM_SEL | | | 0.8 | V |
| | Continuous current, data line inputs, SDP or CDP mode, DP_IN to DP_OUT, DM_IN to DM_OUT | | | ±30 | mA |
| | Continuous current, data line inputs, BC1.2 DCP mode, DP_IN to DM_IN | | | ±15 | mA |
| I_{OUT} | Continuous output current, OUT | 0 | | 2.5 | A |
| | Continuous output sink current, \overline{FAULT} , \overline{STATUS} | 0 | | 10 | mA |
| R_{ILIM_XX} | Current-limit set resistors | 16.9 | | 750 | kΩ |
| T_J | Operating virtual junction temperature | -40 | | 125 | °C |

ELECTRICAL CHARACTERISTICS

Unless otherwise noted: $-40 \leq T_J \leq 125^\circ\text{C}$, $4.5 \text{ V} \leq V_{IN} \leq 5.5 \text{ V}$, $V_{EN} = V_{IN}$, $V_{ILIM_SEL} = V_{IN}$, $V_{CTL1} = V_{CTL2} = V_{CTL3} = V_{IN}$. $R_{\overline{FAULT}} = R_{\overline{STATUS}} = 10 \text{ k}\Omega$, $R_{ILIM_HI} = 20 \text{ k}\Omega$, $R_{ILIM_LO} = 80.6 \text{ k}\Omega$. Positive currents are into pins. Typical values are at 25°C . All voltages are with respect to GND.

| PARAMETER | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|--|-----|------|------|------|
| POWER SWITCH | | | | | |
| $R_{DS(on)}$ On resistance ⁽¹⁾ | $T_J = 25^\circ\text{C}$, $I_{OUT} = 2 \text{ A}$ | | 73 | 84 | mΩ |
| | $-40^\circ\text{C} \leq T_J \leq 85^\circ\text{C}$, $I_{OUT} = 2 \text{ A}$ | | 73 | 105 | |
| | $-40^\circ\text{C} \leq T_J \leq 125^\circ\text{C}$, $I_{OUT} = 2 \text{ A}$ | | 73 | 120 | |
| t_r OUT voltage rise time | $V_{IN} = 5 \text{ V}$, $C_L = 1 \mu\text{F}$, $R_L = 100 \Omega$ (see Figure 23 and Figure 24) | 0.7 | 1.0 | 1.60 | ms |
| t_f OUT voltage fall time | | 0.2 | 0.35 | 0.5 | |
| t_{on} OUT voltage turn-on time | $V_{IN} = 5 \text{ V}$, $C_L = 1 \mu\text{F}$, $R_L = 100 \Omega$ (see Figure 23 and Figure 25) | | 2.7 | 4 | ms |
| t_{off} OUT voltage turn-off time | | | 1.7 | 3 | |
| I_{REV} Reverse leakage current | $V_{OUT} = 5.5 \text{ V}$, $V_{IN} = V_{EN} = 0 \text{ V}$, $-40 \leq T_J \leq 85^\circ\text{C}$, Measure I_{OUT} | | | 2 | μA |
| DISCHARGE | | | | | |
| R_{DCHG} OUT discharge resistance | $V_{OUT} = 4 \text{ V}$, $V_{EN} = 0 \text{ V}$ | 400 | 500 | 630 | Ω |
| t_{DCHG} OUT discharge hold time | Time $V_{OUT} < 0.7 \text{ V}$ (see Figure 26) | 205 | 310 | 450 | ms |

- (1) Pulse-testing techniques maintain junction temperature close to ambient temperature; Thermal effects must be taken into account separately.

ELECTRICAL CHARACTERISTICS (continued)

Unless otherwise noted: $-40 \leq T_J \leq 125^\circ\text{C}$, $4.5 \text{ V} \leq V_{\text{IN}} \leq 5.5 \text{ V}$, $V_{\text{EN}} = V_{\text{IN}}$, $V_{\text{ILIM_SEL}} = V_{\text{IN}}$, $V_{\text{CTL1}} = V_{\text{CTL2}} = V_{\text{CTL3}} = V_{\text{IN}}$. $R_{\overline{\text{FAULT}}} = R_{\text{STATUS}} = 10 \text{ k}\Omega$, $R_{\text{ILIM_HI}} = 20 \text{ k}\Omega$, $R_{\text{ILIM_LO}} = 80.6 \text{ k}\Omega$. Positive currents are into pins. Typical values are at 25°C . All voltages are with respect to GND.

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|--|---|------|------|------|------------------|

(2) These parameters are provided for reference only and do not constitute part of TI's published device specifications for purposes of TI's product warranty.

(3) Pulse-testing techniques maintain junction temperature close to ambient temperature; Thermal effects must be taken into account separately.

ELECTRICAL CHARACTERISTICS, HIGH-BANDWIDTH SWITCH

Unless otherwise noted: $-40 \leq T_J \leq 125^\circ\text{C}$, $4.5\text{ V} \leq V_{IN} \leq 5.5\text{ V}$, $V_{EN} = V_{IN}$, $V_{ILIM_SEL} = V_{IN}$, $V_{CTL1} = V_{CTL2} = V_{CTL3} = V_{IN}$. $R_{FAULT} = R_{STATUS} = 10\text{ k}\Omega$, $R_{ILIM_HI} = 20\text{ k}\Omega$, $R_{ILIM_LO} = 80.6\text{ k}\Omega$. Positive currents are into pins. Typical values are at 25°C . All voltages are with respect to GND.

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|---|---|-----|------|------|---------------|
| HIGH-BANDWIDTH ANALOG SWITCH | | | | | | |
| DP/DM switch on resistance | $V_{DP/DM_OUT} = 0\text{ V}$, $I_{DP/DM_IN} = 30\text{ mA}$ | | | 2 | 4 | Ω |
| | $V_{DP/DM_OUT} = 2.4\text{ V}$, $I_{DP/DM_IN} = -15\text{ mA}$ | | | 3 | 6 | |
| Switch resistance mismatch between DP / DM channels | $V_{DP/DM_OUT} = 0\text{ V}$, $I_{DP/DM_IN} = 30\text{ mA}$ | | | 0.05 | 0.15 | Ω |
| | $V_{DP/DM_OUT} = 2.4\text{ V}$, $I_{DP/DM_IN} = -15\text{ mA}$ | | | 0.05 | 0.15 | |
| DP/DM switch off-state capacitance ⁽¹⁾ | $V_{EN} = 0\text{ V}$, $V_{DP/DM_IN} = 0.3\text{ V}$, $V_{ac} = 0.6\text{ V}_{pk-pk}$, $f = 1\text{ MHz}$ | | | 3 | 3.6 | pF |
| DP/DM switch on-state capacitance ⁽²⁾ | $V_{DP/DM_IN} = 0.3\text{ V}$, $V_{ac} = 0.6\text{ V}_{pk-pk}$, $f = 1\text{ MHz}$ | | | 5.4 | 6.2 | pF |
| O_{IRR} | Off-state isolation ⁽³⁾ | $V_{EN} = 0\text{ V}$, $f = 250\text{ MHz}$ | | 33 | | dB |
| X_{TALK} | On-state cross channel isolation ⁽³⁾ | $f = 250\text{ MHz}$ | | 52 | | dB |
| | Off state leakage current | $V_{EN} = 0\text{ V}$, $V_{DP/DM_IN} = 3.6\text{ V}$, $V_{DP/DM_OUT} = 0\text{ V}$, measure I_{DP/DM_OUT} | | 0.1 | 1.5 | μA |
| BW | Bandwidth (-3dB) ⁽³⁾ | $R_L = 50\ \Omega$ | | 2.6 | | GHz |
| t_{pd} | Propagation delay ⁽³⁾ | | | 0.25 | | ns |
| t_{SK} | Skew between opposite transitions of the same port ($t_{PHL} - t_{PLH}$) | | | 0.1 | 0.2 | ns |

(1) The resistance in series with the parasitic capacitance to GND is typically $250\ \Omega$.

(2) The resistance in series with the parasitic capacitance to GND is typically $150\ \Omega$.

(3) These parameters are provided for reference only and do not constitute part of TI's published device specifications for purposes of TI's product warranty.

ELECTRICAL CHARACTERISTICS, CHARGING CONTROLLER

Unless otherwise noted: $-40 \leq T_J \leq 125^\circ\text{C}$, $4.5\text{ V} \leq V_{IN} \leq 5.5\text{ V}$, $V_{EN} = V_{IN}$, $V_{ILIM_SEL} = V_{IN}$, $V_{CTL1} = 0\text{ V}$, $V_{CTL2} = V_{CTL3} = V_{IN}$. $R_{FAULT} = R_{STATUS} = 10\text{ k}\Omega$, $R_{ILIM_HI} = 20\text{ k}\Omega$, $R_{ILIM_LO} = 80.6\text{ k}\Omega$, Positive currents are into pins. Typical values are at 25°C . All voltages are with respect to GND.

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|-------------------------------------|---|--|------|------|------|---------------|
| SHORTED MODE | | VCTL1 = VIN, VCTL2 = VCTL3 = 0V | | | | |

PIN FUNCTIONS

| NO. | NAME | TYPE ⁽¹⁾ | DESCRIPTION |
|-----|----------------------------|---------------------|--|
| 1 | IN | P | Input voltage and supply voltage; connect 0.1 μ F or greater ceramic capacitor from IN to GND as close to the device as possible |
| 2 | DM_OUT | I/O | D– data line to USB host controller |
| 3 | DP_OUT | I/O | D+ data line to USB host controller |
| 4 | ILIM_SEL | I | Logic-level input signal used to control the charging mode, current limit threshold, and load detection; see the control truth table |
| 5 | EN | I | Logic-level input for turning the power switch and the signal switches on/off; logic low turns off the signal and power switches and holds OUT in discharge. |
| 6 | CTL1 | I | Logic-level inputs used to control the charging mode and the signal switches; see the control truth table |
| 7 | CTL2 | I | |
| 8 | CTL3 | I | |
| 9 | $\overline{\text{STATUS}}$ | O | Active-low open-drain output, asserted in load detection conditions |
| 10 | DP_IN | I/O | D+ data line to downstream connector |
| 11 | DM_IN | I/O | D– data line to downstream connector |
| 12 | OUT | P | Power-switch output |
| 13 | $\overline{\text{FAULT}}$ | O | Active-low open-drain output, asserted during over-temperature or current limit conditions |
| 14 | GND | P | Ground connection |
| 15 | ILIM_LO | I | External resistor used to set the low current-limit threshold and the load detection current threshold. A resistor to ILIM_LO is optional; see Current-Limit Settings in DETAILED DESCRIPTION. |
| 16 | ILIM_HI | I | External resistor used to set the high current-limit threshold |
| NA | PowerPAD | | Internally connected to GND; used to heat-sink the part to the circuit board traces. Connect to GND plane. |

(1) G = Ground, I = Input, O = Output, P = Power

FUNCTIONAL BLOCK DIAGRAM

DETAILED DESCRIPTION

Overview

The following overview references various industry standards. It is always recommended to consult the most up-to-date standard to ensure the most recent and accurate information. Rechargeable portable equipment requires an external power source to charge its batteries. USB ports are a convenient location for charging because of an available 5 V power source. Universally accepted standards are required to make sure host and client-side devices operate together in a system to ensure power management requirements are met. Traditionally, USB host ports following the USB 2.0 specification must provide at least 500 mA to downstream client-side devices. Because multiple USB devices can be attached to a single USB port through a bus-powered hub, it is the responsibility of the client-side device to negotiate its power allotment from the host to ensure the total current draw does not exceed 500 mA. In general, each USB device is granted 100 mA and may request more current in 100 mA unit steps up to 500 mA. The host may grant or deny based on the available current.

Additionally, the success of USB has made the mini-USB connector a popular choice for wall adapter cables. This allows a portable device to charge from both a wall adapter and USB port with only one connector. One common difficulty has resulted from this. As USB charging has gained popularity, the 500 mA minimum defined by USB 2.0 or 900 mA for USB 3.0 has become insufficient for many handset and personal media players which need a higher charging rate. Wall adapters can provide much more current than 500mA/900mA. Several new standards have been introduced defining protocol handshaking methods that allow host and client devices to acknowledge and draw additional current beyond the 500mA/900mA minimum defined by USB 2.0/3.0 while still using a single micro-USB input connector.

The TPS2543 supports three of the most common protocols:

- USB Battery Charging Specification BC1.2
- Chinese Telecommunications Industry Standard YD/T 1591-2009
- Divider Mode

All three methods have similarities and differences, but the biggest commonality is that all three define three types of charging ports that provide charging current to client-side devices. These charging ports are defined as:

- Standard Downstream Port (SDP)
- Charging Downstream Port (CDP)
- Dedicated Charging Port (DCP)

BC1.2 defines a Charging Port as a downstream facing USB port that provides power for charging portable equipment.

Table 1 shows the differences between these ports according to BC1.2 .

Table 1. Operating Modes

| PORT TYPE | SUPPORT USB 2.0 COMMUNICATION | MAX. ALLOWABLE CURRENT DRAW BY PORTABLE DEVICE (A) |
|---------------|-------------------------------|--|
| SDP (USB 2.0) | Yes | 0.5 |
| SDP (USB 3.0) | Yes | 0.9 |
| CDP | Yes | 1.5 |
| DCP | No | 1.5 |

BC1.2 defines the protocol necessary to allow portable equipment to determine what type of port it is connected to so that it can allot its maximum allowable current draw. The hand-shaking process has two steps. During step one, the primary detection, the portable equipment outputs a nominal 0.6-V output on its D+ line and reads the voltage input on its D- line. The portable device concludes it is connected to an SDP if the voltage is less than the nominal data detect voltage of 0.3 V. The portable device concludes that it is connected to a Charging Port if the D- voltage is greater than the nominal data detect voltage of 0.3 V and less than 0.8 V. The second step, the secondary detection, is necessary for portable equipment to determine between a CDP and a DCP. The portable device outputs a nominal 0.6 V output on its D- line and reads the voltage input on its D+ line. The portable device concludes it is connected to a CDP if the data line being read remains less than the nominal data detect voltage of 0.3 V. The portable device concludes it is connected to a DCP if the data line being read is greater than the nominal data detect voltage of 0.3V and less than 0.8 V.

Standard Downstream Port (SDP) USB 2.0/USB 3.0

An SDP is a traditional USB port that follows USB 2.0/3.0 protocol and supplies a minimum of 500 mA/900 mA per port. USB 2.0/3.0 communications is supported, and the host controller must be active to allow charging.

Charging Downstream Port (CDP)

A CDP is a USB port that follows USB BC1.2 and supplies a minimum of 1.5 A per port. It provides power and meets USB 2.0 requirements for device enumeration. USB 2.0 communications is supported, and the host controller must be active to allow charging. What separates a CDP from an SDP is the host-charge handshaking logic that identifies this port as a CDP. A CDP is identifiable by a compliant BC1.2 client device and allows for additional current draw by the client device.

The CDP hand-shaking process is two steps. During step one the portable equipment outputs a nominal 0.6 V output on its D+ line and reads the voltage input on its D- line. The portable device concludes it is connected to an SDP if the voltage is less than the nominal data detect voltage of 0.3 V. The portable device concludes that it is connected to a Charging Port if the D- voltage is greater than the nominal data detect voltage of 0.3V and less than 0.8 V.

The second step is necessary for portable equipment to determine between a CDP and a DCP. The portable device outputs a nominal 0.6 V output on its D- line and reads the voltage input on its D+ line. The portable device concludes it is connected to a CDP if the data line being read remains less than the nominal data detect voltage of 0.3 V. The portable device concludes it is connected to a DCP if the data line being read is greater than the nominal data detect voltage of 0.3V and less than 0.8 V.

Dedicated Charging Port (DCP)

A DCP only provides power and does not provide data connection to an upstream port. A DCP is identified by the electrical characteristics of its data lines. The TPS2543 emulates two common charging standards namely, BC1.2 and Chinese Telecommunications Industry Standard YD/T 1591-2009, and one brand unique DCP charging scheme which will be referred to as Divider scheme.

DCP BC 1.2 and YD/T 1591-2009

Both standards defines that the D+ and D- data lines should be shorted together with a maximum series impedance of 200 Ω. This is shown in [Figure 28](#).

Figure 28. DCP Supporting BC 1.2/YD/T 1591-2009

DCP Divider Charging Scheme

There are two Divider charging schemes supported by the device, Divider 1 and Divider 2 as shown in [Figure 29](#) and [Figure 30](#). In Divider 1 charging scheme the device applies 2.0V and 2.7V to D+ and D- data line respectively. This is reversed in Divider 2 mode shown in [Figure 30](#).

Figure 29. DCP Divider 1 Scheme

Figure 30. Divider 2 Scheme

Divider 1 voltage configuration is required for 1A (max) iPhone device charging while Divider 2 will allow fast charging iPad devices at 2.1A.

DCP Auto Mode

The TPS2543 integrates an auto-detect feature that supports the above DCP schemes. It starts in Divider 1 scheme, if a BC1.2 or YD/T 1591-2009 compliant device is attached, the TPS2543 responds by discharging OUT, turning back ON the power switch and operating in BC1.2 DCP. It then stays in that mode until the device releases the data line, in which case it goes back to Divider Mode.

Also, the TPS2543 will automatically switch between the Divider 1 and Divider 2 schemes based on charging current drawn by the connected device. Initially the device will set the data lines to Divider 1 mode. If charging current of >750mA is measured by the TPS2543 it switches to Divider 2 scheme and test to see if the peripheral device will still charge at a high current. If it does then it stays in Divider 2 scheme otherwise it will revert to Divider 1 scheme.

DCP Forced Shorted / DCP Forced Divider 1

In this mode the device is permanently set to one of the DCP schemes (BC 1.2/ YD/T 1591-2009 or Divider 1) as commanded by its control pin setting per device truth table.

High-Bandwidth Data Line Switch

The TPS2543 passes the D+ and D- data lines through the device to enable monitoring and handshaking while supporting charging operation. A wide bandwidth signal switch is used, allowing data to pass through the device without corrupting signal integrity. The data line switches are turned on in any of CDP or SDP operating modes. The EN input also needs to be at logic High for the data line switches to be enabled.

NOTE

1. While in CDP mode, the data switches are ON even while CDP handshaking is occurring.
2. The data line switches are OFF if EN or all CTL pins are held low, or if in DCP mode. They are not automatically turned off if the power switch (IN to OUT) is in current limit.
3. The data switches are for USB 2.0 differential pair only. In the case of a USB 3.0 host, the super speed differential pairs must be routed directly to the USB connector without passing through the TPS2543.

Device Operation

Please refer to the simplified device state diagram in [Figure 31](#). Power-on-reset (POR) holds device in initial state while output is held in discharge mode. Any POR event will take the device back to initial state. After POR clears, device goes to the next state depending on the CTL lines as shown in [Figure 31](#).

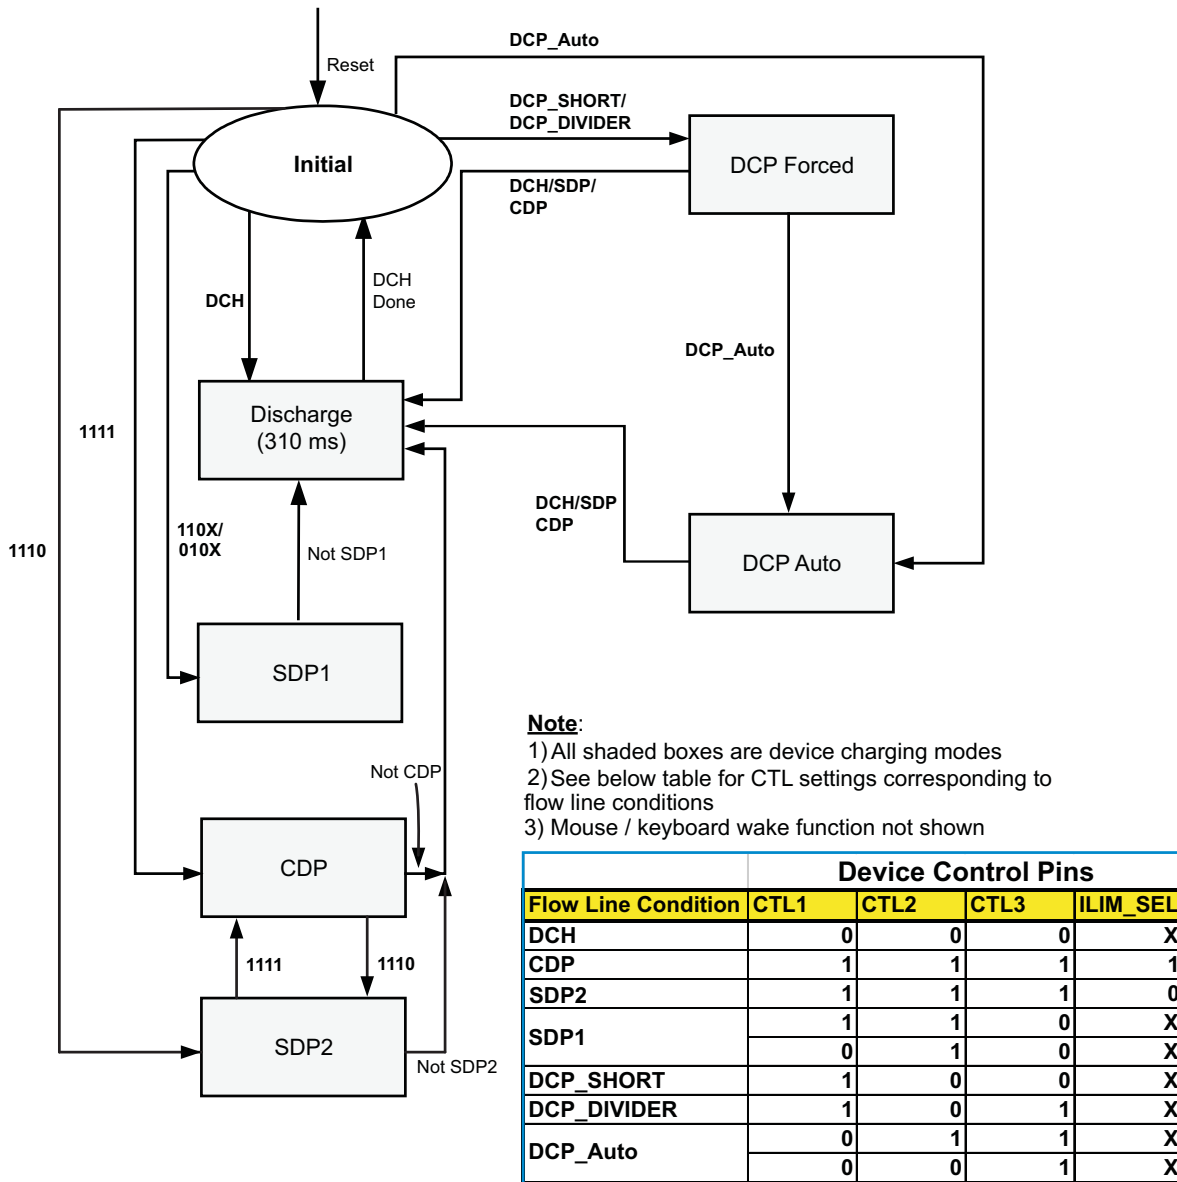

Figure 31. TPS2543 Charging States

Output Discharge

To allow a charging port to renegotiate current with a portable device, TPS2543 uses the OUT discharge function. It proceeds by turning off the power switch while discharging OUT, then turning back on the power switch to reassert the OUT voltage. This discharge function is automatically applied as shown in device state diagram.

Mouse/Key Board Wake Function

The TPS2543 supports **low speed** HID (human interface device like mouse/key board) wake function. It does not support Full Speed HID. There are two scenarios under which wake on mouse is supported by the TPS2543. They are:

1. CDP/SDP2 (111X) to DCP/Auto (011X)
2. SDP1 (010X) to DCP/Auto (011X)

Below description illustrates wake on mouse operation for scenario 1, same holds true for scenario 2.

When a low speed compliant device is attached to the TPS2543, charging port D- line will be pulled high in its idle state (mouse/keyboard not activated). TPS2543 will monitor D- data line continuously. When device is in CDP (1111) or SDP2 (1110) or SDP1 (010X) mode and system is commanded to go to sleep state, the device CTL setting is also changed. Assuming it is changed to DCP/Auto, 011X, having previously detected a HID attachment the device will simply ignore the command to go to DCP/Auto mode and stay in CDP/SDP2 state to support wake on mouse function. When the USB low speed HID is activated (clicked) while system is in S3 (sleep) mode the high speed switch within the TPS2543 allows the transfer of signal from the HID device to the USB host. The USB host subsequently wakes the system and changes CTL setting of the TPS2543 back to CDP/SDP2 mode. Activating (clicking) the low speed device makes the D- data line go back low momentarily, this triggers an internal timer within the TPS2543 to count down. If after ~64ms the CTL lines are still set at 011X (DCP/Auto) the device will immediately switch to DCP/Auto mode and disconnect the mouse from the host. To prevent this, the CTL setting must be made in less then 64 ms after HID device activation otherwise mouse/KB function will be lost. See [Figure 32](#) scope plot for an event sequence where mouse connection is maintained at wake.

Mouse Wake from Sleep

Figure 32. Mouse Wake from Sleep Scope Plot

Device Truth Table (TT)

Device TT lists all valid bias combinations for the three control pins CTL1-3 and ILIM_SEL pin and their corresponding charging mode. It is important to note that the TT *purposely* omits matching charging modes of the TPS2543 with global power states (S0-S5) as device is agnostic to system power states. The TPS2543 monitors its CTL inputs and will transition to whatever charging state it is commanded to go to (except when LS HID device is detected). For example if sleep charging is desired when system is in standby or hibernate state then user must set TPS2543 CTL pins to correspond to DCP_Auto charging mode per below table. When system is put back to operation mode then set control pins to correspond to SDP or CDP mode and so on.

Table 2. Truth Table

| CTL1 | CTL2 | CTL3 | ILIM_SEL | MODE | CURRENT LIMIT SETTING | STATUS OUTPUT (Active low) | COMMENT |
|------|------|------|----------|--------------------|---------------------------------------|---------------------------------|---|
| 0 | 0 | 0 | 0 | Discharge | NA | OFF | OUT held low |
| 0 | 0 | 0 | 1 | Discharge | NA | OFF | |
| 0 | 0 | 1 | 0 | DCP_Auto | ILIM_HI | OFF | Data Lines Disconnected |
| 0 | 0 | 1 | 1 | DCP_Auto | I_{OS_PW} & ILIM_HI ⁽¹⁾ | DCP load present ⁽²⁾ | Data Lines Disconnected and Load Detect Function Active |
| 0 | 1 | 0 | 0 | SDP | ILIM_LO | OFF | Data Lines connected |
| 0 | 1 | 0 | 1 | SDP | ILIM_HI | OFF | |
| 0 | 1 | 1 | 0 | DCP_Auto | ILIM_HI | OFF | Data Lines Disconnected |
| 0 | 1 | 1 | 1 | DCP_Auto | ILIM_HI | DCP load present ⁽³⁾ | Data Lines Disconnected and Load Detect Function Active |
| 1 | 0 | 0 | 0 | DCP_Shorted | ILIM_LO | OFF | Device Forced to stay in DCP BC 1.2 charging mode |
| 1 | 0 | 0 | 1 | DCP_Shorted | ILIM_HI | OFF | |
| 1 | 0 | 1 | 0 | DCP / Divider1 | ILIM_LO | OFF | Device Forced to stay in DCP Divider 1 Charging Mode |
| 1 | 0 | 1 | 1 | DCP / Divider1 | ILIM_HI | OFF | |
| 1 | 1 | 0 | 0 | SDP | ILIM_LO | OFF | Data Lines Connected |
| 1 | 1 | 0 | 1 | SDP | ILIM_HI | OFF | |
| 1 | 1 | 1 | 0 | SDP ⁽⁴⁾ | ILIM_LO | OFF | |
| 1 | 1 | 1 | 1 | CDP ⁽⁴⁾ | ILIM_HI | CDP load present ⁽⁵⁾ | Data Lines Connected and Load Detect Active |

- (1) TPS2543 : Current limit (I_{OS}) is automatically switched between I_{OS_PW} and the value set by ILIM_HI according to the Load Detect – Power Wake functionality.
- (2) DCP Load present governed by the “Load Detection – Power Wake” limits.
- (3) DCP Load present governed by the “Load Detection – Non Power Wake” limits.
- (4) No OUT discharge when changing between 1111 and 1110.
- (5) CDP Load present governed by the “Load Detection – Non Power Wake” limits and BC 1.2 primary detection.

Table 3 can be used as an *aid* to program the TPS2543 per system states however not restricted to below settings only.

Table 3. Control Pin Settings Matched to System Power States

| SYSTEM GLOBAL POWER STATE | TPS2543 CHARGING MODE | CTL1 | CTL2 | CTL3 | ILIM_SEL | CURRENT LIMIT SETTING |
|---------------------------|---|------|------|------|----------|-----------------------|
| S0 | SDP | 1 | 1 | 0 | 1 or 0 | ILIM_HI / ILIM_LO |
| S0 | SDP, no discharge to / from CDP | 1 | 1 | 1 | 0 | ILIM_LO |
| S0 | CDP, load detection with ILIM_LO + 60mA thresholds or if a BC1.2 primary detection occurs | 1 | 1 | 1 | 1 | ILIM_HI |
| S4/S5 | Auto mode, load detection with power wake thresholds | 0 | 0 | 1 | 1 | ILIM_HI |
| S3/S4/S5 | Auto mode, no load detection | 0 | 0 | 1 | 0 | ILIM_HI |
| S3 | Auto mode, keyboard/mouse wake up, load detection with ILIM_LO + 60 mA thresholds | 0 | 1 | 1 | 1 | ILIM_HI |
| S3 | Auto mode, keyboard/mouse wake-up, no load detection | 0 | 1 | 1 | 0 | ILIM_HI |
| S3 | SDP, keyboard/mouse wake-up | 0 | 1 | 0 | 1 or 0 | ILIM_HI / ILIM_LO |

Load Detect

TPS2543 offers system designers unique power management strategy not available in the industry from similar devices. There are two power management schemes supported by the TPS2543 via the STATUS pin, they are:

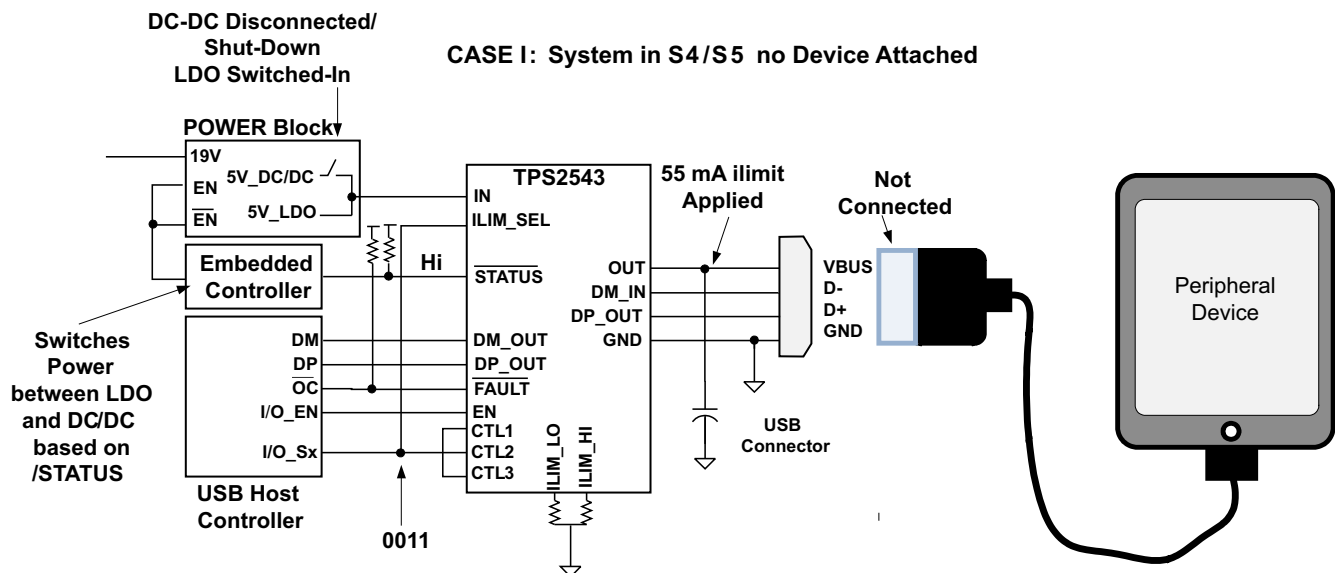

1. Power Wake (PW)
2. Port Power Management (PPM)

Either feature may be implemented in a system depending on power savings goals for the system. In general Power Wake feature is used mainly in mobile systems like a notebook where it is imperative to save battery power when system is in deep sleep (S4/S5) state. On the other hand Port Power Management feature would be implemented where multiple charging ports are supported in the same system and system power rating is not capable of supporting full charging on multiple ports *simultaneously*.

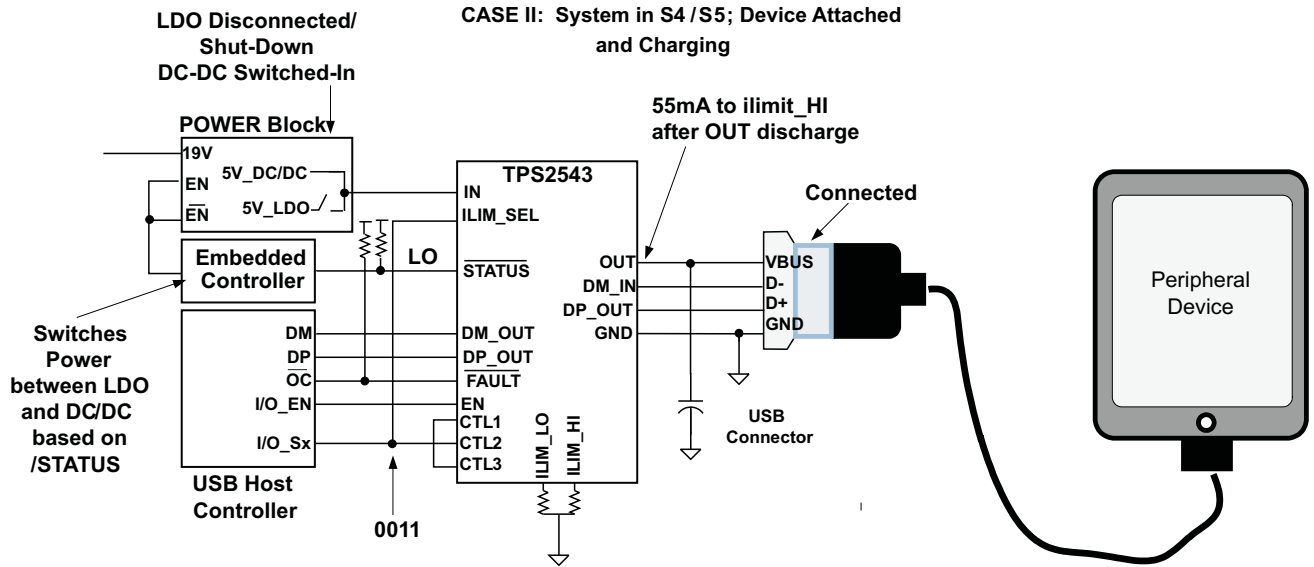

Power Wake

Goal of power wake feature is to save system power when system is in S4/S5 state. In S4/S5 state system is in deep sleep and typically running off the battery; so every “mW” in system power savings will translate to extending battery life. In this state the TPS2543 will monitor charging current at the OUT pin and provide a mechanism via the STATUS pin to switch-out the high power DC-DC controller and switch-in a low power LDO when charging current requirement is <45mA (typ). This would be the case when no peripheral device is connected at the charging port or if a device has attained its full battery charge and draws <45mA.

As shown in below when system is in S4/S5 mode (0011 setting, see device truth table) and no device is connected to the charging port (Case I) system runs off a 100mA LDO. Also note TPS2543 will automatically set its ilimit to 55mA (typ) irrespective of ILIM_LO and ILIM_Hi setting.

Now when a device is attached (CASE II) and draws >55 mA of charging current the TPS2543 will hit its internal current limit as the current drawn by the attached device will exceed the 55mA ilimit threshold. This will trigger the device to assert STATUS to turn on the main power supply and discharge OUT for 310ms (typ) to allow the main power supply to turn on. After the discharge the device will turn back on with current limit set by ILIM_HI. In Case III as the attached device is being charged the TPS2543 will monitor its load current. STATUS remains asserted until load current drops below 45mA (typ) for a continuous period of 15s indicating that the attached device is fully charged. At this point STATUS de-asserts and ilimit is set back to 55mA as shown below.

Port Power Management

Port power management is for systems that have multiple charging ports but cannot power them all simultaneously. Goal of this feature is two fold:

1. Enhances user experience since user does not have to search for charging port
2. Power supply only has to be designed for a reasonable charging load

All ports are allowed to broadcast high current charging, charging current limit is based on ILIM_HI resistor setting. System monitors STATUS to see when high current loads are present. Once allowed number of ports assert STATUS, remaining ports are toggled to a non-charging port. Non-charging ports are SDP ports with current limit based on ILIM_LO. TPS2543 allows for a system to toggle between charging and non-charging ports either with an OUT discharge or without an OUT discharge.

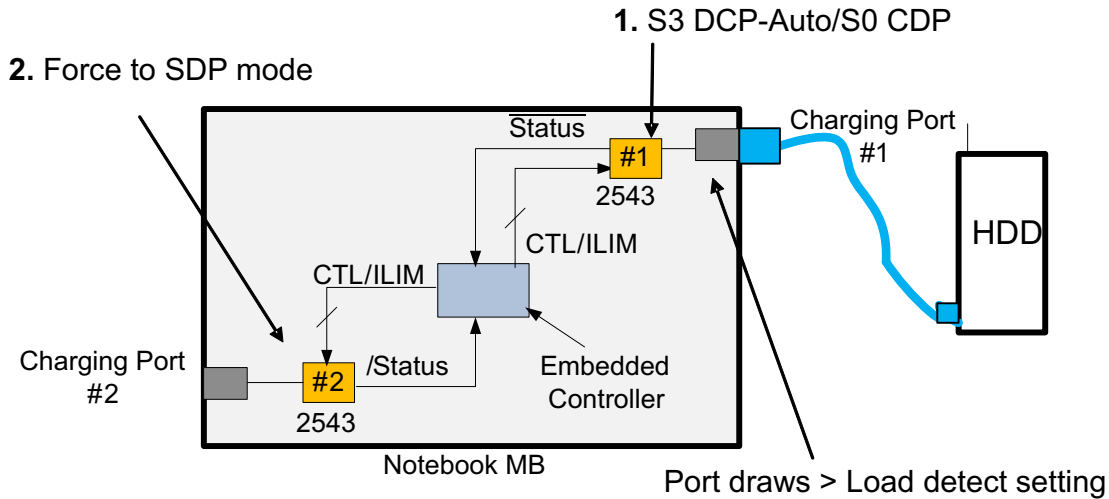

Figure 33. Implementing Port Power Management in a System Supporting Two Charging Ports

Over-Current Protection

When an over-current condition is detected, the device maintains a constant output current and reduces the output voltage accordingly. Two possible overload conditions can occur. In the first condition, the output has been shorted before the device is enabled or before VIN has been applied. The TPS2543 senses the short and immediately switches into a constant-current output. In the second condition, a short or an overload occurs while the device is enabled. At the instant the overload occurs, high currents may flow for nominally one to two microseconds before the current-limit circuit can react. The device operates in constant-current mode after the current-limit circuit has responded. Complete shutdown occurs only if the fault is present long enough to activate thermal limiting. The device will remain off until the junction temperature cools approximately 20°C and will then re-start. The device will continue to cycle on/off until the over-current condition is removed.

Current-Limit Settings

The TPS2543 has two independent current limit settings that are each programmed externally with a resistor. The ILIM_HI setting is programmed with R_{ILIM_HI} connected between ILIM_HI and GND. The ILIM_LO setting is programmed with R_{ILIM_LO} connected between ILIM_LO and GND. Consult the Device Truth Table (Table 2) to see when each current limit is used. Both settings have the same relation between the current limit and the programming resistor.

R_{ILIM_LO} is optional and the ILIM_LO pin may be left unconnected if the following conditions are met:

1. ILIM_SEL is always set high
2. Load Detection - Port Power Management is not used
3. Mouse / Keyboard wake function is not used

If conditions 1 and 2 are met but the mouse / keyboard wake function is also desired, it is recommended to use R_{ILIM_LO} < 80.6 kΩ.

The following equation programs the typical current limit:

$$I_{OS_typ} (mA) = \frac{50,500}{(R_{ILIM_XX} (k\Omega) + 0.1)} \tag{1}$$

R_{ILIM_XX} corresponds to either R_{ILIM_HI} or R_{ILIM_LO} as appropriate.

Figure 34.

Many applications require that the current limit meet specific tolerance limits. When designing to these tolerance limits, both the tolerance of the TPS2543 current limit and the tolerance of the external programming resistor must be taken into account. The following equations approximate the TPS2543 minimum / maximum current limits to within a few mA and are appropriate for design purposes. The equations do not constitute part of TI's published device specifications for purposes of TI's product warranty. These equations assume an ideal - no variation - external programming resistor. To take resistor tolerance into account, first determine the minimum / maximum resistor values based on its tolerance specifications and use these values in the equations. Because of the inverse relation between the current limit and the programming resistor, use the maximum resistor value in the I_{OS_min} equation and the minimum resistor value in the I_{OS_max} equation.

$$I_{OS_min} \text{ (mA)} = \frac{45,661}{(R_{ILIM_XX} \text{ (k}\Omega) + 0.1)^{0.98422}} - 30 \tag{2}$$

$$I_{OS_max} \text{ (mA)} = \frac{55,639}{(R_{ILIM_XX} \text{ (k}\Omega) + 0.1)^{1.0143}} + 30 \tag{3}$$

Figure 35.

Figure 36.

The traces routing the R_{ILIM_XX} resistors should be a sufficiently low resistance as to not affect the current-limit accuracy. The ground connection for the R_{ILIM_XX} resistors is also very important. The resistors need to reference back to the TPS2543 GND pin. Follow normal board layout practices to ensure that current flow from other parts of the board does not impact the ground potential between the resistors and the TPS2543 GND pin.

FAULT Response

The $\overline{\text{FAULT}}$ open-drain output is asserted (active low) during an over-temperature or current limit condition. The output remains asserted until the fault condition is removed. The TPS2543 is designed to eliminate false $\overline{\text{FAULT}}$ reporting by using an internal deglitch circuit for current limit conditions without the need for external circuitry. This ensures that $\overline{\text{FAULT}}$ is not accidentally asserted due to normal operation such as starting into a heavy capacitive load. Over-temperature conditions are not deglitched and assert the $\overline{\text{FAULT}}$ signal immediately.

Undervoltage Lockout (UVLO)

The undervoltage lockout (UVLO) circuit disables the power switch until the input voltage reaches the UVLO turn-on threshold. Built-in hysteresis prevents unwanted oscillations on the output due to input voltage drop from large current surges.

Thermal Sense

The TPS2543 protects itself with two independent thermal sensing circuits that monitor the operating temperature of the power distribution switch and disables operation if the temperature exceeds recommended operating conditions. The device operates in constant-current mode during an over-current condition, which increases the voltage drop across power switch. The power dissipation in the package is proportional to the voltage drop across the power switch, so the junction temperature rises during an over-current condition. The first thermal sensor turns off the power switch when the die temperature exceeds 135°C and the part is in current limit. The second thermal sensor turns off the power switch when the die temperature exceeds 155°C regardless of whether the power switch is in current limit. Hysteresis is built into both thermal sensors, and the switch turns on after the device has cooled by approximately 20°C. The switch continues to cycle off and on until the fault is removed. The open-drain false reporting output $\overline{\text{FAULT}}$ is asserted (active low) during an over-temperature shutdown condition.

PACKAGING INFORMATION

| Orderable Device | Status ⁽¹⁾ | Package Type | Package Drawing | Pins | Package Qty | Eco Plan ⁽²⁾ | Lead/ Ball Finish | MSL Peak Temp ⁽³⁾ | Samples (Requires Login) |
|------------------|-----------------------|--------------|-----------------|------|-------------|----------------------------|----------------------|------------------------------|-----------------------------|
| TPS2543RTER | ACTIVE | WQFN | RTE | 16 | 3000 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-2-260C-1 YEAR | |
| TPS2543RTET | ACTIVE | WQFN | RTE | 16 | 250 | Green (RoHS & no Sb/Br) | CU NIPDAU | Level-2-260C-1 YEAR | |

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

THERMAL PAD MECHANICAL DATA

RTE (S-PWQFN-N16)

PLASTIC QUAD FLATPACK NO-LEAD

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
